

Strings: Definitions and Operations

Thomas Schwarz, SJ

String Definition

- Strings are defined as text enclosed with single or double quotation mark
- Within the text we can use the other quotation marks without problem
- ```
a_string = 'He said: "Hello."'
another_string = "What's its worth?"
```

# String Definition

- Example:

```
>>> astring = "Hello World"
>>> bstring = 'Hello World'
>>> astring == bstring
True
```

# String Definition

- To import long strings with newlines:
  - Use the triple quotes:

```
results = '''
a=145, b=345
a=250, b=332
a=307, b=301
a=346, b=298
'''
```

- But we can also use the newline character:

```
results = '\na=145, b=345\na=50, b=332\n'
```

# String Definition

- Some characters within a string are compounded:
  - Backslash followed by a letter
    - Newline: `\n` translated by Python into the appropriate sequence for the OS,
      - can also use `\r` carriage return or `\f` formfeed
    - Tab: `\t`
    - `\'` , `\"` the single and double quotation mark
    - `\\` the backslash
    - `\v` a vertical tab

# String Definition

- The backslash is the *escape* character
- Python is very good at interpreting your intent
  - E.g. my attempt at a swimmer doodle
    - Internally, backslashes are inserted
- Basically, an invalid escape sequence uses a literal backslash

```
>>> astring = '_o/\ '
>>> astring
'_o/\\ '
>>> print(astring)
_o/\
```

# String Definition

- Special characters not on your keyboard:
  - Can insert unicode with
    - `\u....` sequence
      - Replace the dots with the unicode
      - E.g.: `print (' \u0904)` yields  
ऐ

0900

Devanagari

|   | 090 | 091 | 092 | 093 | 094 | 095 | 096 | 097 |
|---|-----|-----|-----|-----|-----|-----|-----|-----|
| 0 | ॐ   | ऐ   | ठ   | र   | ी   | ॐ   | ऋ   | ०   |
| 1 | ँ   | ऑ   | ड   | र   | ु   | ं   | ऌ   | ं   |
| 2 | ं   | ओ   | ढ   | ल   | २   | ०   | ३   | अँ  |
| 3 | ः   | ओ   | ण   | ळ   | ०   | े   | ०   | अ   |
| 4 | ऐ   | औ   | त   | ळ   | ०   | े   | ।   | आ   |
| 5 | अ   | क   | थ   | व   | ँ   | ँ   | ॥   | औ   |
| 6 | आ   | ख   | द   | श   | े   | ०   | ०   | अु  |
| 7 | इ   | ग   | ध   | ष   | े   | ०   | १   | अु  |
| 8 | ई   | घ   | न   | स   | ै   | ०   | २   | ०   |
| 9 | उ   | ङ   | न   | ह   | ाँ  | ख   | ३   | ज़  |
| A | ऊ   | च   | प   | ं   | ो   | ग   | ४   | ष   |
| B | ऋ   | छ   | फ   | ाँ  | ो   | ज़  | ५   | ग   |
| C | ॠ   | ज   | ब   | ०   | ौ   | ड़  | ६   | ज़  |
| D | ँ   | झ   | भ   | ऽ   | ०   | ढ़  | ७   | २   |
| E | ऐ   | ज   | म   | ा   | ि   | फ़  | ८   | ड   |
| F | ए   | ट   | य   | ि   | ौ   | य   | ९   | ब   |

# String Definition

- If you want to disable the escape character, use raw strings
  - If in the near future, you need to create strings such as http contents, etc,
  - Place an r in front of the string
    - E.g. `print(r'\t\n\r\f')` yields `\t\n\r\f`

# String Operations

- Recall:
  - We can add two strings : concatenation
  - We can multiply a string with an integer (in any order):
    - Example: Print out a line:
      - `print('-'*25)`

# String Operations

- Printing an ASCII chessboard

```
***** ***** ***** *****
***** ***** ***** *****
***** ***** ***** *****
 ***** ***** ***** *****
 ***** ***** ***** *****
 ***** ***** ***** *****
***** ***** ***** *****
***** ***** ***** *****
***** ***** ***** *****
 ***** ***** ***** *****
 ***** ***** ***** *****
 ***** ***** ***** *****
***** ***** ***** *****
***** ***** ***** *****
***** ***** ***** *****
 ***** ***** ***** *****
 ***** ***** ***** *****
 ***** ***** ***** *****
```

# String Operations

- The first line consists of:
  - five asterisks (stars) followed by five white spaces
    - `5*'*' + 5*' '`
  - repeated four times:
    - `4*(5*'*'+5*' ')`
- generalize this by giving names to the arguments
  - `print(fields*(width*'*'+width*' '))`

# String Operations

- And put it into two functions:

- ```
def left(width, height, fields):  
    for _ in range(height):  
        print(fields*(width*' '*width*' '))
```

```
def right(width, height, fields):  
    for _ in range(height):  
        print(fields*(width*' '+width*' '*'))
```

- And put them together:

```
for _ in range(4):  
    left(width=5, height=3, fields=4)  
    right(width=5, height=3, fields=4)
```
