

Midterm Solutions

Problem 1:

```
CREATE TABLE customer (  
    customer_id INT NOT NULL AUTO_INCREMENT,  
    first_name VARCHAR(63),  
    last_name VARCHAR(63),  
    address VARCHAR(255) DEFAULT '',  
    PRIMARY KEY (customer_id)  
);  
  
CREATE TABLE complaint (  
    complaint_id INT NOT NULL AUTO_INCREMENT,  
    customer_id INT,  
    complaint TEXT,  
    PRIMARY KEY (complaint_id),  
    CONSTRAINT FK_customer_id FOREIGN KEY (customer_id)  
        REFERENCES customer (customer_id)  
        ON DELETE CASCADE ON UPDATE CASCADE  
);
```

Problem 2

```
SELECT  
    first_name, last_name  
FROM  
    employees  
    JOIN  
    salaries USING (emp_no)  
WHERE  
    salary = (SELECT  
        MAX(salary)  
        FROM  
        salaries);
```

first_name	last_name	
Dietmar	Brandt	

Problem 3:

```
CREATE TEMPORARY TABLE top_ten_salaries  
(SELECT  
    salary  
FROM  
    salaries  
ORDER BY salary DESC  
LIMIT 10);  
  
SELECT DISTINCT  
    first_name, last_name  
FROM  
    employees  
    JOIN  
    salaries USING (emp_no)  
WHERE  
    salary IN (SELECT
```

first_name	last_name	
Joseph	Carter	
Arjun	Pathak	
Dietmar	Brandt	
Emily	Morgan	

```

        *
FROM
    top_ten_salaries);

```

Problem 4:

```

SELECT
    dep_name, AVG(salary) AS 'Average Salary'
FROM
    salaries
    JOIN
    departments ON dep_no = dep_id
WHERE
    start_day <= '2020-01-06'
    AND end_day >= '2020-01-06'
GROUP BY dep_name;

```

Problem 5:

```

SELECT
    first_name, last_name
FROM
    employees
    JOIN
    salaries USING (emp_no)
    JOIN
    departments ON dep_no = dep_id
WHERE
    office_id IN (SELECT
        office_id
    FROM
        employees
        JOIN
        salaries USING (emp_no)
        JOIN
        departments ON dep_no = dep_id
    WHERE
        employees.first_name = 'Ingrid'
        AND last_name = 'Koch')
    AND hire_day BETWEEN (SELECT
        hire_day
    FROM
        employees
    WHERE
        first_name = 'Ingrid'
        AND last_name = 'Koch') AND (SELECT
        last_day
    FROM
        employees
    WHERE
        first_name = 'Ingrid'
        AND last_name = 'Koch');

```

first_name	last_name	
Ian	Iglesias	
Francisco	Serrano	
Sandra	Gray	
Albert	Evans	
Emilio	Sánchez	
Lisa	Bailey	
Ingrid	Koch	
Jacobo	Sanz	
María	Pérez	
Ishani	Prakash	
Valery	García	
Aarya	Chaudhari	
Beate	Klein	
Pablo	Gómez	
Anja	Lehmann	
Fátima	Rubio	
Marie	Thompson	
Margarete	Weber	
Emma	Carter	
Kanha	Molla	
Srihan	Debbarma	
Rose	Wilson	
Virat	Alam	
Paula	Martín	
Emilio	Marín	

Problem 6:

- (a) InsuranceCompName $\rightarrow$ InsuranceCompAddress and Name, Birthday, Phone $\rightarrow$ Address are functional dependencies (among others) where the left side is not a super-key.
- (b) $\{A\}^+ = \{A, D, E\}$; $\{B\}^+ = \{B\}$; $\{C\}^+ = \{C\}$; $\{D\}^+ = \{A, D, E\}^+$; $\{E\}^+ = \{E\}$.
 $\{A, B\}^+ = \{A, B, D, E\}$; $\{A, C\}^+ = \{A, C, D, E\}$; $\{A, D\}^+ = \{A, D, E\}$;
 $\{A, E\} = \{A, D, E\}$; $\{B, C\}^+ = \{A, B, C\}^+ = \{A, B, C, D, E\}$, i.e. BC is a key.
 $\{B, D\}^+ = \{A, D, E\}$; $\{B, E\}^+ = \{B, E\}$; $\{C, D\}^+ = \{A, C, D, E\}$;
 $\{C, E\}^+ = \{C, E\}$; $\{D, E\}^+ = \{A, D, E\}$.
- (c) We set up a table where each row corresponds to a decomposition table and the columns to the attributes of the original table. This gives us

A	B	C	D	E
a	b_1	c	d	e_1
a	b	c_2	d_2	e
a_3	b	c_3	d	e_3

We first apply $A \rightarrow D$. This gives

A	B	C	D	E
a	b_1	c	d	e_1
a	b	c_2	d	e
a_3	b	c_3	d	e_3

We then can apply $A \rightarrow E$. This gives

A	B	C	D	E
a	b_1	c	d	e
a	b	c_2	d	e
a_3	b	c_3	d	e_3

We can apply $D \rightarrow A$. This gives

A	B	C	D	E
a	b_1	c	d	e
a	b	c_2	d	e
a	b	c_3	d	e_3

We can apply $D \rightarrow E$. This gives

A	B	C	D	E
a	b_1	c	d	e
a	b	c_2	d	e
a	b	c_3	d	e

No more functional dependencies will change the table. We can now construct a counterexample by just using this table as relations in the original database table. This table fulfills all functional dependencies

A	B	C	D	E
<i>a</i>	<i>b</i> ₁	<i>c</i>	<i>d</i>	<i>e</i>
<i>a</i>	<i>b</i>	<i>c</i> ₂	<i>d</i>	<i>e</i>
<i>a</i>	<i>b</i>	<i>c</i> ₃	<i>d</i>	<i>e</i>

and has projections

A	C	D
<i>a</i>	<i>c</i>	<i>d</i>
<i>a</i>	<i>c</i> ₂	<i>d</i>
<i>a</i>	<i>c</i> ₃	<i>d</i>

A	B	E
<i>a</i>	<i>b</i> ₁	<i>e</i>
<i>a</i>	<i>b</i>	<i>e</i>

B	D
<i>b</i> ₁	<i>d</i>
<i>b</i>	<i>d</i>

When we join, we get

A	B	C	D	E
<i>a</i>	<i>b</i> ₁	<i>c</i>	<i>d</i>	<i>e</i>
<i>a</i>	<i>b</i> ₁	<i>c</i> ₂	<i>d</i>	<i>e</i>
<i>a</i>	<i>b</i> ₁	<i>c</i> ₃	<i>d</i>	<i>e</i>
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>a</i>	<i>b</i>	<i>c</i> ₂	<i>d</i>	<i>e</i>

A	B	C	D	E
<i>a</i>	<i>b</i>	<i>c</i> ₃	<i>d</i>	<i>e</i>

which obviously has more rows than the original database table.
